

The blood pressure values are lower than expected.

There could be a few reasons that the CODA detects reduced blood pressure values. The most common causes are related to a low tail blood volume (indicated by a tail temperature that is too low), or cuffs that are too large or placed too loosely on the tail.

Please send us a sample of your data in Simple Report form, a few screenshots of the graphs from that session and a photo of your set up with the cuffs on the animals' tails. We will be happy to review it with you.
